Notes:

1. The controller, without any additional power supply, can support up to 8 Uni-I/O™ modules, either plugged directly into the I/O Bus connector on the side of the controller, or via a Local Expansion Kit. If more Uni-I/O™ modules are required, you must use a Local Expansion Kit with a power supply, this enables a single controller to support up to 16 modules.
2. The Local Expansion Kits comprise a Base unit, an End unit, and a connecting cable. You must plug the Base Unit into the last Uni-I/O™ module plugged into the controller.
If no module is present, plug the Base unit into the I/O Bus connector.
3. Uni-COM™ CB modules plug directly into the Uni-COM Jack on the side of the controller. Uni-COM modules may be installed in the following configurations:
 - If a module comprising a serial port is plugged directly into the controller, it may be followed only by another serial module, for a total of 2.
 - If your configuration includes a CANbus module, it must be plugged directly into the controller. The CANbus module may be followed by up to two serial modules, for a total of 3.
 For more information, refer to the product's installation guide.
4. When replacing the unit's battery, make sure that the new one has environmental specifications that are similar or better than the one specified in this document.
5. The USB device port is used to connect the device to a PC.
6. The 4-20mA input option is implemented using 0-20mA input range.
7. The analog inputs measure values that are slightly higher than the nominal input range (Input Over-range).
Note that when the input overflow occurs, it is indicated in the corresponding I/O Status tag as well as by the respective input LED (see LED Indications), while the input value is registered as the maximum permissible value. For example, if the specified input range is 0 ÷ 10V, the Over-range values can reach up to 10.15V, and any input voltage higher than that will still register as 10.15V while the Overflow system tag is turned on.
8. See LED Indications Table for description of the relevant indications. Note that the diagnostics results are also indicated in the system tags and can be observed through the UniApps™ or the online state of the UniLogic®.
9. Step response and update time are independent of the number of channels that are used.
10. Life expectancy of the relay contacts depends on the application that they are used in. The product's installation guide provides procedures for using the contacts with long cables or with inductive loads.
11. Outputs O0 and O1 can be configured as either normal digital outputs or as PWM outputs. PWM outputs specifications apply only when outputs are configured as PWM outputs.
12. This refers to the CONFIRM button on the controller USB Actions; press it if the indication requires.
